

ABSTRACT OF THE DISCLOSURE

A modular power control apparatus for use with a plurality of peripheral devices. A plurality of modules, which connect to the peripheral devices, are supported
5 by a housing. An interface module is supported by the housing to selectively interface with the plurality of modules for routing data to an appropriate module and peripheral device. A data communication cable is connected to the interface module for transferring data between the interface module and anyone of a variety of devices. A power source is also connected to the housing. The vehicle assembly is characterized by a modular
10 connector supported by the housing and electrically connected to the power source. The modular connector includes a plurality of identical slots with the plurality of modules and the interface module being electrically connected to any one of the identical slots to transfer data between the modules and to provide electrical power to at least one of the modules, thereby facilitating communication with the peripheral devices and providing
15 electrical power to at least one of the peripheral devices within the vehicle assembly.
